Integrated regional models are conceptual and mathematical models that describe the physical environment, biological interactions, human decision-making, and human impact on the environment. Efforts are now being made to integrate regional models from the physical, biological and social sciences in order to respond to diverse environmental problems. This volume explores the latest research developments on processes operating at a variety of scales, including regions, and how scientists can combine their efforts to develop models linking biological, physical, and human systems. Data requirements for successful integrated regional models are identified and discussed. Chapters also consider methodological questions, such as whether to integrate disciplinary approaches at the beginning or the end of the modelling process, and whether integrated regional models should focus on specific regions or specific problems. The information in this volume will enable the reader to view problems such as coastal zone management, atmospheric pollution, non-point source pollution, commodity production in forested areas, and urban expansion in a broad, conceptual context. Researchers and graduate students in ecology, biology, geography and geology will benefit from this innovative approach to contemporary environmental problems.

Visionary designer and technologist John Maeda defines the fundamental laws of how computers think, and why you should care even if you aren't a programmer. "Maeda is to design what Warren Buffett is to finance." --Wired John Maeda is one of the world's preeminent interdisciplinary thinkers on technology and design. In *How to Speak Machine*, he offers a set of simple laws that govern not only the computers of today, but the unimaginable machines of the future. Technology is already more powerful than we can comprehend, and getting more powerful at an exponential pace. Once set in motion, algorithms never tire. And when a program's size, speed, and tirelessness combine with its ability to learn and transform itself, the outcome can be unpredictable and dangerous. Take the seemingly instant transformation of Microsoft's chatbot Tay into a hate-spewing racist, or how crime-predicting algorithms reinforce racial

bias. How to Speak Machine provides a coherent framework for today's product designers, business leaders, and policymakers to grasp this brave new world. Drawing on his wide-ranging experience from engineering to computer science to design, Maeda shows how businesses and individuals can identify opportunities afforded by technology to make world-changing and inclusive products--while avoiding the pitfalls inherent to the medium.

Engaging science writing that bravely approaches a new frontier in medical science and offers a whole new way of looking at the deep kinship between animals and human beings. *Zoobiquity*: a species-spanning approach to medicine bringing doctors and veterinarians together to improve the health of all species and their habitats. In the tradition of Temple Grandin, Oliver Sacks, and Neil Shubin, this is a remarkable narrative science book arguing that animal and human commonality can be used to diagnose, treat, and ultimately heal human patients. Through case studies of various species--human and animal kind alike--the authors reveal that a cross-species approach to medicine makes us not only better able to treat psychological and medical conditions but helps us understand our deep connection to other species with whom we share much more than just a planet. This revelatory book reaches across many disciplines--evolution, anthropology, sociology, biology, cutting-edge medicine and zoology--providing fascinating insights into the connection between animals and humans and what animals can teach us about the human body and mind.

Under the influence of the global spread of human rights, legal disputes are increasingly framed in human rights terms. Parties to a legal dispute can often invoke human rights norms in support of their competing claims. Yet, when confronted with cases in which human rights conflict, judges face a dilemma. They have to make difficult choices between superior norms that deserve equal respect. In this high-level book, the author sets out how judges the world over could resolve conflicts between human rights. He presents an innovative legal theoretical account of such conflicts, questioning the relevance of the influential proportionality test to their resolution. Instead, the author develops a novel resolution framework, specifically designed to tackle human rights conflicts. The book combines concerted normative theory with profound practical analysis, firmly rooting its theoretical arguments in human rights practice. Although the analysis draws primarily on the case law of the European Court of Human Rights, the book's core arguments are applicable to judicial practice in general. As such, the book should be of great interest to academics, postgraduate students and legal practitioners in Europe and beyond. The book is particularly suited for use in advanced courses on legal theory, human rights law and jurisprudence.

One of the world's leading managers in the field of Artificial Intelligence unveils the secrets to creating synergy between human and artificial intelligence that will revolutionize our world. Today, we are merely at the threshold of the acceleration of the Digital Era. But what will happen in the coming years, when artificial intelligence (AI) is going to dramatically change the world? A machine can use big data to generate information better than humans. However, a machine can't understand context, doesn't have feelings or ethics, and can't think 'out of the box'. Therefore, rather than prioritize between humans and machines, we should create The Human-Machine Team, which will combine human intelligence and artificial intelligence, creating a 'super cognition'. Brigadier General Y.S, an expert analyst, technology director, commander of an elite intelligence unit, and winner of the prestigious Israel Defense Prize for his artificial intelligence based anti-terrorism project, wrote his book, *The Human-Machine Team*, to address how the combination between human and artificial intelligence can solve national security challenges and threats, lead to victory in war, and be a growth engine for humankind. He offers a new perspective on how to lead nations and organizations to the future that has already become the present.

This anthology, from the literature of sociology and other disciplines as well, examines the various roles that animals play in human societies. It covers a full spectrum of human-animal interaction: pets and companions; animals as sources of food, clothing and labor; animals in captivity; humans and wildlife; animals as research subjects; and animals as objects of recreation and sport. "Between the Species" represents many of the leading experts in this field, including the authors, who co-edit a scholarly series on animals, society, and culture.

*Human Colonization of the Arctic: The Interaction Between Early Migration and the Paleoenvironment* explores the relationship between humans and the environment during this early time of colonization, utilizing analytical methods from both the social and natural sciences to develop a unique, interdisciplinary approach that gives the reader a much broader understanding of the interrelationship between humanity and the environment. As colonization of the polar region was intermittent and irregular, based on how early humans interacted with the land, this book provides a glance into how humans developed new ways to make the region more habitable. The book applies not only to the physical continents, but also the arctic waters. This is how humans succeeded in crossing the Bering Strait and water area between Canadian Arctic Islands. About 4500 years ago, humans reached the northern extremity of Greenland and were able to live through the months of polar nights by both adapting to, and making, changes in their environment. Written by pioneering experts who understand the relationship between humans and the environment in the arctic *Addresses why the patterns of colonization were so irregular* Includes coverage of the earliest examples of humans, developing an understanding of ecosystem services for economic development in extreme climates Covers both terrestrial and aquatic ecosystems
