Group

Database design is the organization of data according to a database model. The designer determines what data must be stored and how the data elements interrelate. With this information, they can begin to fit the data to the database model. Database management system manages the data accordingly. Database design involves classifying data and identifying interrelationships. This theoretical representation of the data is called an ontology. The ontology is the theory behind the database's design.

Database Design A

Objective: to practice formulating simple queries in relational algebra. Then, you will summarize your database knowledge by designing two databases. 1. A company organizes its activities in projects. Products that are used in the projects are bought from suppliers. This is described in a database with the following schema:

Database Design is the process of designing the database, developing and implementing and maintaining the enterprise data management systems. This design has the data model for a database written in data definition language with the physical and logical storage parameters which is later used to create a database.
