After observing trends in the properties of the elements when arranged by increasing atomic mass, Dmitri Mendeleev proposed the periodic law and predicted the existence and properties of at least three undiscovered elements. With the Density is a Periodic Property: Discovering an Element—ChemTopic™ Lab Activity, measure mass and volume data for silicon, tin and lead; calculate their densities; and use the results to predict the density of germanium, Mendeleev ' s " undiscovered " element.

The fact that an element exists as a solid does not indicate that it is denser than a liquid element. Mercury has a density of 13.53 grams per cubic centimeter and is a liquid while aluminum has a density of 2.70 grams per cubic centimeter and is a solid.

What Is the Trend of Density in the Periodic Table?

Periodicity refers to a property possessed by the elements of the Periodic property wherein after a particular interval the properties of elements repeat themselves. eg: lets take an example of sodium(Na), it is a highly electropositive element. Similarly potassium(K), has high electro-positivity. based on periodicity, the elements are grouped ...

What is periodicity? What are periodic properties? - UrbanPro

The periodic table arranges the elements by periodic properties, which are recurring trends in physical and chemical characteristics. These trends can be predicted merely by examining the periodic table and can be explained and understood by analyzing the electron configurations of the elements. Elements tend to gain or lose valence electrons to achieve stable octet formation.
