Oxidative Stress and Antioxidant Protection: The Science of Free Radical Biology and Disease Oxidative Stress and Antioxidant Protection begins with a historical perspective of pioneers in oxidative stress with an introductory section that explains the basic principles related to oxidative stress in biochemistry and molecular biology, demonstrating both pathways and biomarkers. This section also covers diagnostic imaging and differential diagnostics. The following section covers psychological, physiologic, pharmacologic and pathologic correlates. This section addresses inheritance, gender, nutrition, obesity, family history, behavior modification, natural herbal-botanical products, and supplementation in the treatment of disease. Clinical trials are also summarized for major medical disorders and efficacy of treatment, with particular focus on inflammation, immune response, recycling, disease progression, outcomes and interventions. Each of the chapters describes what biomarker(s) and physiological functions may be relevant to a concept of specific disease and potential alternative therapy. The chapters cover medical terminology, developmental change, effects of aging, senescence, lifespan, and wound healing, and also illustrates cross-over exposure to other fields. The final chapter covers how and when to interpret appropriate data used in entry level biostatistics and epidemiology. Authored and edited by leaders in the field, Oxidative Stress and Antioxidant Protection will be an invaluable resource for students and researchers studying cell biology, molecular biology, and biochemistry, as well professionals in various health science fields.

This is a succinct single-volume work covering the whole field of diagnostic imaging and interventional radiology that gives basic radiological knowledge required in the initial stages of training. The greater use of imaging by clinicians, the introduction of new imaging modalities and the wide acceptance of interventional radiology has greatly increased the scope and importance of radiology. Each chapter describes the use of various imaging modalities and then gives an account of the radiological changes in disease enumerating the likely diagnosis and signs rather than producing encyclopaedic lists. The important role of interventional radiology is brought to the fore. It is not possible in a book this size to give details of the pathological aspects of the various conditions nor to discuss patient management. The aim is to give the trainee radiologist and the interested clinician an introduction to the wide field of radiology. The most appropriate imaging modalities are suggested together with the indications for interventional procedures. Chapters incorporate those medical conditions appropriate for radiology trainees as well as a list of approximately 10-15 review articles or relevant books are included for further reading at the end of each chapter. This enables the student to obtain in-depth information that is beyond the scope of the book.
