Tissues from the body taken for diagnosis of disease processes must be processed in the histology laboratory to produce microscopic slides that are viewed under the microscope by pathologists. The techniques for processing the tissues, whether biopsies, larger specimens removed at surgery, or tissues from autopsy, are described below.

The next step in histological preparation is embedding, which involves supporting specimens in media that has similar mechanical rigidity to the specimen itself.

Download Free Histologic Preparations

Choosing the right embedding medium is critical, because if it is too stiff or too weak, defects may occur while sectioning. By far, the most common media used for embedding is paraffin wax.

~~Historical Sample Prep for a Light Microscope~~ Protocol

Various agents can be used for infiltrating and supporting specimens including epoxy and methacrylate resins but paraffin wax-based histological waxes are the most popular for routine light microscopy. This produces so-called "paraffin sections". These sections are usually prepared with a "rotary" microtome.
