methods--comparison of colored pictures to live or mounted specimens, and use of illustrated dichotomous keys--full biological accounts emphasize points for identification, behaviors, and habitats. Distribution maps show where various species and subspecies can be found. The authors promote a new and exciting activity of insect watching as an alternative or supplement to collecting (the general feeling among "butterfliers" and dragonfly and damselfly enthusiasts). Communicating primarily through the un-refereed journal Cincindela, (Tiger Beetler) specialists themselves prefer the term, "cicindelophiles." They represent an ardent subset of the growing number of serious amateur naturalists who invest in outdoor activities seeking and identifying birds, butterflies, dragonflies, flowering plants, and various other forms of life.

Primitive Photography considers the hand-made photographic process in its entirety, showing the reader how to make box-cameras, lenses, paper negatives and salt prints, using inexpensive tools and materials found in most hardware and art-supply stores. Step-by-step procedures are presented alongside theoretical explanations and historical background. Streamlined calotype procedures are demonstrated, featuring different paper negative processes and overlooked, developing-out printing methods. Primitive Photography combines the simplicity of pinhole photography, the handmade quality of alternative processes, and the precision of large-format. For those seeking alternatives to commercially prepared material as well as digital photography, it provides the instructions for creating the entire photographic process from the ground up. Given its scope and treatment of the photographic process as a whole, this may be the first book of its kind to appear in over a century.
