The higher complexity of variable-speed variable-pitch turbines is offset by the benefits of control flexibility, namely, higher conversion efficiency, better power quality, longer useful life; because of the immediate impact of control on the cost of wind energy, reliable high-performance controllers are essential in making wind technology competitive. In Wind Turbine Control Systems the application of linearparameter varying (LPV) gain scheduling techniques to the control of wind energy ...

Modern wind turbines generally operate at variable speed in order to maximise the conversion efficiency below rated power and to reduce loading on the drive-train. In addition, pitch control of the blades is usually employed to limit the energy captured during operation above rated wind speed. The higher complexity of variable-speed variable-pitch turbines is offset by the benefits of control flexibility, namely, higher conversion efficiency, better power quality, longer useful life; because ...

Wind turbine control systems are typically divided into three functional elements:

- 1.the control of groups of wind turbines in a wind farm, 2.the supervising control of each individual wind turbine, and
- 3.separate dedicated dynamic controllers for different wind turbine sub-systems.

## 1 Wind Turbine Control - University of Notre Dame

Wind turbine control is necessary to ensure low maintenance costs and efficient performance. The control system also guarantees safe operation, optimizes power output, and ensures long structural life. Turbine rotational speed and the generator speed are two key areas that you must control for power limitation and optimization.

When the wind strikes the rotor blades, blades start rotating. The turbine rotor is connected to a high-speed gearbox. Gearbox transforms the rotor rotation from low speed to high speed. The high-speed shaft from the gearbox is coupled with the rotor of the generator and hence the electrical generator runs at a higher speed.

The power in the wind is proportional to the wind speed cubed; the general formula for power in the wind is: where  $P$  is the power available in watts,  $\rho$  is the density of air (which is approximately  $1.2\text{kg/m}^3$ )

## 4.7.2 Principles of Wind Energy Conversion

In "Wind Turbine Control Systems", the application of linear parameter varying (LPV) gain scheduling techniques to the control of wind energy conversion systems is emphasised. This reformulation of the classical gain scheduling problem allows a straightforward design procedure and simple controller implementation.
